CADENCE: **IT AND SECURITY**

One HTML file of about 4 MB, opened in Edge or Chrome from the common folder. Nothing is installed, and it makes no network calls.

WHERE THE DATA GOES

No web. Opened as a file, the page's own rule (a Content Security Policy) makes the browser refuse every web address: only what is inside the file can be used.

CONTROLS

Storage	One file per record, AES-GCM-256 with a new IV each time. Staff records use the team's data key; each agent's records use that agent's own key.
Accounts	Made in the tool by the admin. Passwords: PBKDF2-SHA256, 600,000 rounds, 16-byte salts. Keys: RSA-OAEP 2048. Account files hold only scrambled passwords and locked keys.
Access	Seven roles; each person sees only what the role allows. Every change to results, rules and roles is logged with a name and a time.
Email	Never sent by the tool: drafts only. Header injection is guarded; attachments carry no National IDs.
Files out	CSV cells that begin with = + - or @ are written as text, so Excel never runs them.
Backups	.mcbak files locked with their own password (PBKDF2, 600,000 rounds); a backup cannot replace accounts or keys.
Code	No npm packages in the page; the two bundled libraries are pinned by SHA-256 and checked by the tests. Text from files is escaped on every page.
Testing	Unit tests and 37 browser test suites run before every change; a security review was done and every finding fixed with a test.

KNOWN LIMITS, SAID PLAINLY

- Staff share one data key, and it is not rotated.
- Whoever can replace the HTML controls the sessions that open it: keep it read-only for everyone but its owner.
- Admins should use long passphrases; backup passwords are kept apart from sign-in passwords.

WHAT WE ASK OF IT

- Nothing to install.
- If a policy stops Edge or Chrome opening folders, allow it for this file.
- Later, for phones and work from anywhere: a SharePoint library for MC Data, then a Microsoft 365 connection.
